

Minimum-incidence deletion (Theorem 4.2)

$$d(C) = \arg \min_{v \in C} \sum_{u \in C \setminus \{v\}} \text{sim}(u, v), \quad \text{avgSim}(C \setminus \{d(C)\}) \geq \text{avgSim}(C)$$

Canonical chain for C_1

Canonical chain for C_2

Reverse DFS follows only the blue canonical insertions.

The alternative path to C_2 is rejected without a visited table; C_1 and C_2 become output candidates.
